Sampling

Sampling Procedure

The SHS 2013 interviewed 852 urban and 873 rural households. The frame used for selecting enumeration areas (EAs) was a mixed frame where the database of EAs for the UNFPA urban survey was used for all urban areas (in two strata: Hergaisa and Other Urban). The rural frame used the list of polling stations which was provided by the electoral commission.The sample frame used was the 2012 cartographic list of enumeration areas.

The sample employs a stratified two-staged clustered design with the Primary Sampling Unit (PSU) being the enumeration area. Within each enumeration area, 9 households were selected for interviews. Then, a listing approach was used to select these 9 households randomly for interviews. Three primary strata were defined as: rural, Hergaisa and other urban areas. The population proportion varied by stratum, and the general agreement in informal discussions was that about 50% of the population was urban and 50% were rural.

Deviations from Sample Design

A total of 26 EAs had to be replaced, and except in the case of Hergaisa, the replacements were rural polling stations. The most prevalent problem in the rural area were in the Sool, Sannag and Sahil zones, and these were identified as problems with security. A practical approach was undertaken by using the "nearest secure neighbor". The idea was to assure that the sample polling station in the same district had similar characteristics to those of the insecure sample PSU, in order to maintain the geographic representativeness of the sample and reduce the bias from the PSU nonresponse

Weighting

The sampling weight is the inverse probability of selection, (calculated by multiplying the probabilities at each sampling stage). The selection probability for a household can be decomposed into the selection probability of the EA and the selection probability of the household within the EA.

Description	This report is prepared by the World Bank Poverty Global Practice based on the Somaliland Household Survey (SHS), which was completed in 2013. The report uses the SHS 2013 to construct a consumption based measure of poverty and inequality, and provides a quantitative assessment of demographic and welfare characteristics of the poor. It also undertakes more in-depth analysis on two issues that initial analysis showed to be of prime importance to achieve poverty reduction and shared prosperity in Somaliland: the impact of remittances income on poverty and access to education. The objective of the report is to increase understanding of the multiple dimensions of poverty in Somaliland, and to understand the key characteristics of the poorest households and the economic activities from which they derive their living. A better understanding of the nature of poverty and the economic characteristics of those in poverty provides an insight into the nature of economic growth that is most likely to benefit poverty reduction.
